

Twelfth Census of the United States

BULLETIN No. 17

**DOMESTIC ANIMALS IN BARNS AND
INCLOSURES, NOT ON FARMS
OR RANGES**

Statistics of Agriculture

WASHINGTON
CENSUS OFFICE
1900

EXPLANATORY NOTE.

The geographical groups of states used in the following bulletin are those established by the Eleventh Census. The divisions of the United States included in each group are as follows:

North Atlantic division; Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont.

South Atlantic division; Delaware, District of Columbia, Florida, Georgia, Maryland, North Carolina, South Carolina, Virginia, West Virginia.

North Central division; Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, Wisconsin.

South Central division; Alabama, Arkansas, Indian Territory, Kentucky, Louisiana, Mississippi, Oklahoma, Tennessee, Texas.

Western division; Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, Wyoming.

Twelfth Census of the United States.

CENSUS BULLETIN.

No. 17.

WASHINGTON, D. C.

November 23, 1900.

DOMESTIC ANIMALS NOT ON FARMS OR RANGES.

This bulletin has been prepared under the direction of Mr. LE GRAND POWERS, chief statistician for agriculture. It presents the results of one part of the special inquiries relating to live stock, authorized by Congress, in an Act, amendatory to the law relating to the Twelfth Census, approved February 1, 1900.

By that amendment the census authorities were directed to collect statistics, not authorized by the original Act, relating to two classes of domestic animals. The first class consists of live stock upon the unfenced public domain or ranges, of the West and South; the second, of domestic animals not located on what are popularly known as farms or ranges. In the second class are included all domestic animals in cities, towns, and villages; in stock yards; all employed in manufacturing, lumbering and mining industries, and kindred enterprises; and all used for pleasure or profit by individuals other than farm proprietors.

In this bulletin are presented statistics of the animals in the second class. Similar statistics have never before been collected in the United States. In the census of 1860, the assistant marshals who collected the census data were requested, each in his own subdivision, to prepare, in the course of the enumeration, estimates of the number of animals of each recognized class not found upon farms. The request, it appears, was quite generally complied with. The results will be found upon page 192 of the agricultural volume for that census. In 1870, the Superintendent of the Census, as he states in his report, sought to place himself in possession of all statistical data of a positive character obtainable upon the subject, and upon the basis of such data made estimates of the number of horses and neat cattle not on farms. The results are given on page 75 of the agricultural volume for that census.

In table 5 of the present bulletin is found a summary, by states and territories, of horses and neat cattle reported by the enumerators in 1900, and also of the corresponding estimates made in 1860 and 1870. A careful study of the table will demonstrate the fact that the estimates of 1860 and 1870 were far from accurate. The estimates for horses were, however, more nearly correct than those for neat cattle.

The enumerators generally reported animals on farms on the regular farm schedule, and other live stock on a specially prepared schedule, although in a few instances some animals were reported on one schedule that should properly have been on the other. These errors, however, are purely formal, and are generally easily detected. Most of the reports of animals, which were improperly made on the schedule for live stock not on farms or ranges, have been transferred to their proper places. The reports improperly made on the regular farm schedules cannot, however, be corrected until all those schedules have been prepared for tabulation. It was deemed unwise to delay, for several months, the publication of these tables in order to include the further statistics to which reference has just been made.

The aggregate number of barns or inclosures reporting domestic animals not on farms or ranges, June 1, 1900, was 1,878,207. This was substantially one-third of the total number of farms at the same time in the United States. Of these barns and inclosures, 784,560 contained neat cattle; 1,355,636, horses; 51,808, mules; 6,522, asses and burros; 7,564, sheep; 452,928, swine; and 21,527, goats. The number of various kinds of domestic animals in these barns and inclosures was reported as follows: Neat cattle, 1,466,970; horses, 2,833,877; mules, 162,115; asses and burros, 12,870; sheep, 156,470; swine, 1,592,861; and goats, 47,652.

STATISTICS OF AGRICULTURE.

Detailed reports are made of all these animals under the classification adopted for the Twelfth Census. The results are given in table 1, for the states and territories; in table 2, for the various cities and groups of cities containing over 25,000 inhabitants; and in table 3 for the counties. Table 4 presents for the states and territories the average number of animals in an inclosure; table 6 gives the number of the various animals for each 100,000 inhabitants in the cities for which statistics are printed in table 2; and table 7 is an exhibit of the percentages of inclosures with the various kinds of animals.

As can be seen by a glance at table 4, the average number of neat cattle to an inclosure is smallest in the North Atlantic states and largest in the South Central. In the former it is 1.6 and in the latter 2.5. In the North Atlantic and North Central states there is very little variation in the average number of animals to a barn or inclosure. That average varies from 1.5 to 1.8, with the single exception of Illinois, in which the average is 2.3. The higher average of Illinois is due to the presence in Chicago of stock yards, and in Peoria of extensive feed yards. Of the individual states, Florida reports the largest number of neat cattle to an inclosure. This is 3.6. Louisiana comes next with 3.5; Mississippi and Indian Territory follow with 3.2; Arkansas, 2.9; New Mexico and Colorado, 2.8; Alabama, 2.7; and Texas, 2.5. In the states and territories just mentioned, and to a certain extent in all of the South Atlantic, South Central, and Western states, many animals graze at large upon unfenced land, which is usually spoken of in the West as a "range." All the larger herds and flocks of this kind were reported either on the regular farm schedules or on the special schedule for live stock on ranges, or have been transferred thereto in the tabulation of the data printed in this bulletin. Many smaller herds and flocks of this description reported by the enumerators on the schedule for live stock not on farms or ranges, have not been transferred. When the probable income derived from the animals thus kept was insignificant, they were allowed to remain on the schedules as reported. The existence of these small flocks and herds, most of the time running at large, is a cause of the high average number of neat cattle to an inclosure shown by the accompanying table, in the states and groups of states mentioned. Excluding them, the relative number of neat cattle kept in barns or fenced inclosures is doubtless about the same in the Southern and Western states as in the other great divisions. The average number of neat cattle to an inclosure is smaller in group C, cities of 25,000 to 50,000 inhabitants, than in either of the other groups of cities, or in the United States as a whole. In the smaller cities it approximates 1.7; in the country it is 1.9. For the group of cities containing 50,000 to 100,000 inhabitants each, the average is 2.7, while for the largest cities it is 3.0.

The average number of horses to a barn or inclosure, is lowest in the South Central and highest in the North Atlantic states. In the former it is 1.8, and in the latter 2.4. This is the reverse of the relative figures for neat cattle. This variation is doubtless due to the greater value of land in the larger cities and to the urban sanitary regulations adopted with reference to the keeping of live stock. Both of these factors tend to concentrate the keeping of animals in cities in fewer inclosures as the cities increase in size. This is seen by noting the averages for inclosures containing horses in Manhattan borough and the large cities. For Manhattan borough the average is 19.9; Brooklyn, 4.8; Boston, 7.7; and Philadelphia, 4.7; while that for the country is only 2.1.

The average number of mules to an inclosure is smallest in the North Central and South Central states, in both of which it is 2.7. It is largest in the North Atlantic division, where it is 7. This high average in the last mentioned division is caused by the large number of mules kept in connection with the mines of Pennsylvania.

The sheep tabulated in this bulletin are largely those reported in connection with stock or feed yards in the various parts of the country. They also include a few of those kept on June 1 by individuals who own farms, and at certain seasons of the year have the animals running at large on unfenced land. The grazing of small flocks on unfenced land is quite common in some of the Gulf states of the South. The location of the animals reported accounts for the large average number of sheep to an inclosure. It ranges from 13.2 in the Western states to 31.9 in the North Central. The high averages for Alabama, 42.0; Florida, 40.7; and Georgia, 59.2, represent the average size of the flocks running at large in those states; those for Illinois, New York, Ohio, and Indiana, and for cities containing over 100,000 inhabitants represent sheep kept in feed yards, or in stock yards for slaughter.

Florida reports the largest average number of swine to an inclosure, which is 8.3. That state has many swine running at large. The existence of similar herds in some other states of the South accounts for the other high state averages in that section, and also that of the South Central division as a whole. Stock yard interests give a corresponding average to Illinois and the North Central states.

Goats are more numerous actually and relatively in the South Central division than in the other portions of the United States. In that division the average number reported to an inclosure is 3.9, while in the North Atlantic it is only 1.6, and for the nation 2.2.

The number of different kinds of animals to an inclosure presents but little variation in the several divisions of the country. It is smallest in the North Atlantic states, where it is 1.3, and largest in the South Central, where it is 1.7. In general it is smallest in states in which there is large urban population, and largest in states or territories in which there are no great cities. It is only 1.1 in the cities containing over 50,000 inhabitants; 1.2 in cities containing between 25,000 and 50,000 inhabitants; and 1.5 for the remainder of the United States.

The number of all kinds of domestic animals proportioned to population exhibits in the different states and cities a great variation, as can be seen by a glance at table 6. Most of those variations are due to local causes and conditions. There are, however, certain general causes, among which the most important is the size of cities. Horses, mules, and neat cattle, including dairy cows, are least numerous in the larger cities and most numerous in the smaller ones. Sheep and swine are, however, relatively more numerous in the larger cities than in the smaller. Their greater number is due to the location, in cities like Chicago, of large stock yards and packing houses.

In this connection attention is called to the fact that the most important variation in the work of the local enumerators is found in their reports of dairy cows. Some enumerators quite generally reported them upon the regular farm schedule, and others upon the specially prepared schedule for live stock not on farms. This variation in the methods of work followed by the various enumerators is not of a character to lessen the reliability of the totals reported upon the two schedules. It does modify that obtained by tabulating the data secured on either one of the two schedules. Thus the large relative number of dairy cows given in table 6 for some cities is, doubtless, in part caused by the fact that the enumerators for those cities reported many cows upon the schedules for live stock not on farms which should have been given upon the regular farm schedules. The small relative number of cows in some other cities is also doubtless due to the reverse error. These variations caused by different methods of reporting will all disappear when the results obtained by tabulating the data of the two schedules are combined in the final report of the census. When that is done there will remain only the variations first mentioned—those caused by the size of cities and by the amount of suburban territory within their corporate limits. The above remark with reference to dairy cows will apply, though with less force, to all the other domestic animals reported in these tables.

Attention has been called to the fact that the various enumerators differed in their judgment as to what animals should be reported upon the regular farm schedules and what upon the other schedules. The census of 1900 differs in this respect from those of preceding decades in one particular only. In other decades when an enumerator decided that a given place was not a farm, he made no report of its animals, the land upon which they were kept or the crops raised upon that land. As a result, there were omissions and improper reports upon the regular farm schedules, as in the Twelfth Census. Of the animals improperly omitted from the farm schedule, there was in preceding decades no report of any kind. In the census of 1900 it is otherwise. The animals not reported upon one schedule as the result of an error of judgment on the part of the enumerator, are generally included upon the other. The only omissions found in the combined work are those which are the result of the positive carelessness or neglect of the men or women appointed to gather the necessary data.

For cities with over 100,000 inhabitants, as can be seen by table 6, Kansas City and Memphis report the largest relative number of horses and mules, respectively; Chicago, the largest relative number of sheep; Indianapolis, of swine; and New Orleans and Milwaukee, of goats.

Table 7 presents for certain cities, groups of cities, and the larger divisions of the country, an exhibit of the relative number of barns and inclosures in which the various domestic animals are kept. Those percentages show how a densely populated city has relatively very few of these barns containing domestic animals other than horses. In cities with large suburban areas within their corporate limits, the relative number of inclosures with horses is much less, and that of inclosures with neat cattle is greater. Thus the percentage for inclosures with horses in Manhattan is 97.9, while in Brooklyn it is 96.4; in Greater New York it is 93.3; Cincinnati, 88.0; and in Richmond borough of New York, it is only 84.8. The corresponding percentage for inclosures with neat cattle is for Manhattan, 1.9; Brooklyn, 4.2; Greater New York, 8.4; Cincinnati, 14.1; and for Richmond borough, 23.9.

For cities containing over 100,000 inhabitants, the percentage for horses is 90.1, and for neat cattle, 12.5. In cities with over 50,000 and under 100,000 the percentage for horses was 84.7, and for neat cattle 22.6. In those with over 25,000 and under 50,000 it was, for horses 84.4, and for neat cattle 25.4. In the territory outside of cities with over 25,000 the percentage for horses was 69.0 and for cattle 46.6.

In cities with over 100,000 inhabitants, the relative number of barns or inclosures in which swine are kept is expressed by the percentage 1.0, while in the territory outside of the cities of over 25,000 inhabitants, that percentage is 28.5. The relative numbers for goats are the reverse of those for swine. The percentage of inclosures with goats for the largest cities is 8.2, while in the territory outside of cities it is only .8. In a few cities the relative number of inclosures with goats is quite large. Such is the case with Queens borough of Greater New York, in which it is 10.7.

Subdivisions B and C of table 7 illustrate quite forcibly some of the factors which determine the relative number of inclosures containing various kinds of animals. Subdivision B presents by geographical divisions the percentages for the inclosures with various kinds of animals in the cities with over 25,000 inhabitants. Subdivision C gives in like manner the percentages for the territory exclusive of those cities. The percentages of inclosures with horses are large in the cities, and smaller in the town and country districts. The percentages of neat cattle and swine vary in the opposite manner.

STATISTICS OF AGRICULTURE.

¹ Cities of over 100,000 inhabitants.² Cities of over 50,000 and less than 100,000 inhabitants.³ Cities of over 25,000 and less than 50,000 inhabitants.⁴ Less than one-tenth of one per cent.

Attention is again requested to the fact mentioned in the introduction to this bulletin, that certain enumerators reported domestic animals on the regular farm schedule, which should have been reported upon the schedule for live stock not on farms or ranges. The foregoing tables must, in consequence, be regarded as in a measure provisional. At the present stage of work in the Census Office, it is impossible to detect and include all such cases, and all, therefore, have been omitted. When that work has been completed, the Census Office will publish a supplemental table regarding the animals not on farms or ranges, but returned on the farm schedule. This will include, in addition, live stock in transit June 1, 1900, and not reported by the enumerators, together with animals in the stock and feed yards of certain cities, such as Jersey City, St. Louis, and Kansas City, which were also omitted by the enumerators.

William Ellsworth
Director of the Census.
